BIOLOGICAL ACTIVITY

Description

Onametostat (JNJ-64619178) is a selective, orally active and pseudo-irreversible protein arginine methyltransferase 5 (PRMT5) inhibitor with an IC_{50} of 0.14 nM. Onametostat has potent activity in lung cancer[1][2].

IC_{50} & Target

PRMT5

In Vitro

Onametostat binds simultaneously to the S-adenosylmethionine (SAM)- and protein substrate- binding pockets of the

	PRMT5/MEP50 complex with a pseudo-irreversible mode-of-action. Onametostat shows potent and broad inhibition of cellular growth[1]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.
In Vivo	Oral administration of Onametostat results in efficient inhibition of dimethylation of SMD1/3 proteins, components of the splicing machinery and direct substrates of the methylosome, in several non-small cell lung cancer and small cell lung cancer? cancer mouse xenograft models[1]. MCE has not independently confirmed the accuracy of these methods. They are for reference only.
